# Indian FinTech Research | Zerodha

## Business overview

Zerodha is an Indian securities brokerage and investment technology platform. Its product ecosystem includes Kite (trading), Console (portfolio and reports), and Coin (mutual fund investing). It operates in a regulated environment involving SEBI, exchanges, depositories, clearing and settlement systems.

## Customer journey and data

Typical interactions include account onboarding, searching instruments, placing orders, viewing holdings, and reading statements. Each interaction may produce operational records, application telemetry, and support events. These are potential analytics inputs, subject to privacy and security controls.

## Publicly documented product capabilities

Zerodha publicly documents Kite charts, alerts and nudges, and Console portfolio and reporting features. These are customer-facing information and decision-support capabilities. Their existence does not by itself prove which internal analytics models or KPIs Zerodha uses.

## Potential analytics applications — analyst recommendations, not verified internal practices

**Onboarding funnel:** track step-by-step completion and drop-off to identify confusing screens. **Product engagement:** measure usage of watchlists, reports and alerts to prioritize improvements. **Reliability:** monitor API latency, failed orders, and error rates by time of day. **Customer support:** categorize ticket themes and measure resolution times. **Risk:** flag unusual activity for human review without automatically treating it as misconduct.

## Suggested KPIs

Account activation rate, onboarding completion time, daily active users, feature adoption, support first-response time, order failure rate, p95 API latency, and customer retention. Metrics should be segmented carefully and should not expose personal customer information.

## Recommendations and limitations

Use privacy-preserving aggregated dashboards; document metric definitions; experiment with UI changes where appropriate; monitor fairness and regulatory compliance. This report is based on public product descriptions and conceptual use cases, not internal access or confidential company data.
